

The Versatrak System

For workstations that have no slatwalls but still need to mount monitor arms and other accessories, American has created the Versatrak System. The system includes a flush-mounted track to mount monitor arms, poles, task lights and other peripherals. Incorporated into the embedded track are cable grommets along the entire length so that monitor cables, keyboard and mice cables and cables for other peripherals go directly through the

worksurface into the equipment storage cabinet below. The track ranges from end to end so equipment can be mounted on the track anywhere along the worksurface. The mounting brackets for peripherals are mounted and secured to the track from the top so there is no crawling on your knees to move or secure equipment as with traditional grommet mounted brackets. The track is embedded flush with the worksurface, so it works equally well with free-standing monitors on bases and other peripherals.

Multiple console sections can be attached together without concern for where equipment is positioned. This is especially important when monitors are shared between users. In the Ergonaut workstation to the left, numerous console sections are attached together and there are no impediments underneath that would cause problems when ranging across the entire console. Mounting brackets are available to attach arms and task lights for the most popular manufacturers.
